Case Reports in Cardiac Ventriculography

Home › Journal Details

Case Reports and Case Series in Cardiology Journal Publishes Case Reports of Cardiac Ventriculography, Clinical Videos of Cardiac Ventriculography, Case Reports in Left Heart Ventriculography, Case Reports in Right Heart Ventriculography, Clinical Image of Cardiac Ventriculography, Case Reports in Cardiac Ventriculography, Case Reports in Cardiovascular Ventriculography, Case Reports in Mitral Valve Surgery, Clinical Images of Mitral Valve Surgery, Case Reports in Left Heart Ventricular Angiography, Case Reports in Right Heart Ventricular Angiography, Case Reports in Coronary Angiography, Case Reports in Coronary Heart Ventriculography, Case Reports in Left Heart Catheterization, Case Reports in Right Heart Catheterization, Case Reports in Ejection Fraction etc.

Case Reports and Case Series in Cardiology Journal is an indexed peer reviewed Internationally reputed cardiology journal. It Publishes Types and procedure of Cardiac Ventriculography: Left Heart Ventriculography, Right Heart Ventriculography, Mitral Valve Surgery, Left Heart Ventricular Angiography, Right Heart Ventricular Angiography, Coronary Angiography, Coronary Heart Ventriculography, Left Heart Catheterization, Right Heart Catheterization, Ejection Fraction, Stroke Volume, Cardiac Output.

Case Reports and Case Series in Cardiology Journal is using Editorial Tracking System for quality in review process. Editorial Tracking is an online manuscript submission, review and tracking systems. Review processing is performed by the editorial board members of Case Reports and Case Series in Cardiology Journal at least two independent reviewers approval followed by editor approval is required for acceptance of any citable manuscript. Authors may submit manuscripts and track their progress through the system, hopefully to publication. Reviewers can download manuscripts and submit their opinions to the editor. Editors can manage the whole Submission, Review, Peer review, Revise, Publish Process.

Manuscript Submission

Authors are requested to submit their manuscript by using Online Manuscript Submission Portal: https://www.casereportsincardiology.org/submit (or) also invited to submit through the Journal E-mail Id: editor@casereportsincardiology.org.

Case Reports in Left Heart Ventriculography

Case Reports in Left Heart Ventriculography is a procedure to look at the left-sided heart chambers and the function of the left-sided valves. It is sometimes combined with coronary angiography. A ventriculogram is a test that shows images of your heart. The images show how well your heart is pumping. The pictures let your doctor check the health of the lower chambers of your heart, called ventricles. This test can be done as a non-invasive test or as part of an invasive procedure.

Case Reports in Right Heart Ventriculography

Case Reports in Right Heart Ventriculography is a study that images the right chambers (atrium and ventricle) of the heart. The interior of the heart is composed of valves, chambers, and associated vessels. The external structures of the heart include the ventricles, atria, arteries and veins. It is a ventriculogram test that shows images of the heart.

Case Reports in Mitral Valve Surgery

Case Reports in Mitral Valve Surgery it is a surgical procedure, mitral valve surgery has risks. The most serious complications associated with mitral valve surgery include stroke, placement of a pacemaker, kidney failure, lung failure, and wound infection. Mitral valve repair and mitral valve replacement are types of surgery to fix or replace a leaky or stiff mitral valve in the heart.

Case Reports in Left Heart Ventricular Angiography

Case Reports in Left Heart Ventricular Angiography Left ventricular function was studied in patients with ischaemic heart disease and compared with others patients with normal left ventricular function. The patients in the homogeneous group of ischaemic heart disease were further subdivided into those 'without angina' depending upon the presence of angina during supine leg exercise at the time of definitive study. At rest there was no significant difference in the heart rate, cardiac output, stroke volume. A commonly measured parameter of left ventricular function, failed to reflect consistent changes on exercise as compared to values at rest which emphasizes the limitations of the measurement of ejection fraction at rest.

Case Reports in Right Heart Ventricular Angiography

Case Reports in Right Heart Ventricular Angiography is a study that images the right chambers (atrium and ventricle) of the heart. It will be given local anesthesia where the catheter is inserted. Afterward, the only thing you should feel is pressure at the site. You will not feel the catheter as it is moved through your veins into the right side of the heart. You may feel a flushing sensation or the feeling that you need to urinate as the dye is injected.

Case Reports in Coronary Angiography

Case Reports in Coronary Angiography is a procedure that uses X-ray imaging to see your heart's blood vessels. The test is generally done to see if there's a restriction in blood flow going to the heart. Coronary angiograms are part of a general group of procedures known as heart (cardiac) catheterizations. Cardiac catheterization procedures can both diagnose and treat heart and blood vessel conditions. A coronary angiogram, which can help diagnose heart conditions, is the most common type of cardiac catheterization procedure.

Case Reports in Coronary Heart Ventriculography

Case Reports in Coronary Heart Ventriculography is a medical imaging test used to determine a person's heart function in the right, or left ventricle. Cardiac ventriculography involves injecting contrast media into the heart's ventricle(s) to measure the volume of blood pumped. The images show how well your heart is pumping. The pictures let your doctor check the health of the lower chambers of your heart, called ventricles. This test can be done as a non-invasive test or as part of an invasive procedure.

Left Heart Catheterization Case Reports

Case Reports in Left Heart Catheterization is involves the passage of a catheter into the left side of the heart to obtain diagnostic information about the left side of the heart or to provide therapeutic interventions in certain types of heart conditions. Left heart catheterization is used for diagnostic and therapeutic purposes. Evaluation and treatment of coronary artery disease, Assessment and evaluation of coronary artery bypass grafts. Evaluation and treatment of coronary artery disease in patients with chest pain of uncertain origin, when non-invasive tests are not diagnostic. Assessment of the severity of valvular or myocardial disorders.

Right Heart Catheterization Case Reports

Case Reports in Right Heart Catheterization is a right heart catheter procedure, a catheter is passed into a vein in your neck or groin to measure the pressure in your heart and lungs. The procedure helps your doctor to work out how well your heart is working. It measures blood pressure and oxygen in your lungs and the right side of your heart. It's also called pulmonary artery catheterization. Healthcare providers use right heart catheterization to diagnose and manage many conditions, including: Cardiogenic shock, Cardiomyopathy, Congenital heart disease, Heart failure, Heart valve disease, Pulmonary hypertension.

Case Reports in Ejection Fraction

Ejection Fraction Case Reports is an ejection fraction below 40% means your heart isn't pumping enough blood and may be failing. A low ejection fraction number can be an indicator of heart failure and may not have symptoms at first but can lead to a variety of symptoms, including: Shortness of breath. Fatigue.

Case Reports in Stroke Volume

Stroke Volume Case Reports is the definition of stroke volume is the volume of blood pumped out of the left ventricle of the heart during each systolic cardiac contraction.

Case Reports in Cardiac Output

Cardiac Output Case Reports is the product of heart rate and stroke volume and is measured in liters per minute. Heart rate is most commonly defined as the number of times the heart beats in one minute. Stroke volume is the volume of blood ejected during ventricular contraction or for each stroke of the heart.
